

The Wild World of Weather!

Presentations for elementary and high school students

Choices for 2010 – 2011!

- **The Water Cycle, Clouds and Storms.** Reinforce what the students are already learning about the water cycle using visual imagery, videos and animation while covering all the terms that the students need to know for their tests. We'll even take a look at recent tornado video that will have them talking for days.

- **Severe Storms and Severe Weather Safety.** Violent storms take hundreds of lives every year and cause billions of dollars in damage. As our population increases, more people and property are exposed to risk. We'll learn about the different kinds of severe weather, where and when it strikes and how to keep you and your students safe.

- **The Solar Minimum.** The sun is weaker than it has been in over 200 years and that impacts everything from ocean temperatures to agriculture. We'll look at solar cycles and show the students the latest images and animations of the sun and discuss what we can expect over the next 10 to 100 years.**

- **Mysterious Lights in the Sky.** From unusually vivid displays of Noctilucent Clouds and amazing sunsets to auroras and meteor showers, it's amazing what we can all see by just looking up a little more often! **

- **Custom presentations available.**

** Best for 6th grade or older
